

TradingView Pine Script Signal Engineering

Anonymous engineering case study | Pine Script v5 | Strategy refactoring + configurable alerts

PINE SCRIPT v5	BUY / SELL FOCUS	CI VALIDATED	BASELINE v1.0.0
----------------	------------------	--------------	-----------------

Executive summary

A TradingView strategy was refactored into a lightweight maintained baseline centered on BUY/SELL signals. The work preserved the requested alternate-resolution moving-average signal engine and internal state gate, removed user-facing TP/SL and unrelated chart output, retained strategy entries, and added configurable BUY and SELL alert messages.

The design deliberately retained inherited higher-timeframe lookahead behavior for requested signal parity. Historical signals can therefore change after refresh, so the result is not presented as non-repainting.

Public vs. private boundary

Area	Public showcase	Private delivery
Purpose	Portfolio and capability proof	Engineering source of truth
Source code	Not included	Included
Identity / credentials	Not included	Protected operational context
Proposal sharing	Approved	Not shared

This public repository has independent sanitized history. It is not a fork, mirror, or source-code export.

Engineering response

Isolate the signal path

Reduced the maintained path to configurable moving-average series, alternate-resolution mapping, cross events, an internal state gate, and final BUY/SELL events.

Preserve required dependencies

Retained internal transitions needed by the final entry gate without exposing them as TP/SL orders or chart visuals.

Minimize the chart surface

Limited intended visible output to BUY and SELL labels while retaining strategy entries and configurable alert messages.

Document the timing decision

Recorded the lookahead-related repainting trade-off instead of representing the implementation as forward-safe.

Harden the delivery

Added checksum evidence, architecture, decision record, runbook, security, ownership, handover, and automated repository validation.

KNOWN TIMING
TRADE-OFF

Requested signal parity retained inherited lookahead-enabled higher-timeframe mapping. Historical mapped values can change after refresh. A forward-safe alternative would be separately scoped and would introduce a confirmation-delay trade-off.

Validation evidence

VALIDATION EVIDENCE

Maintained delivery baseline - evidence-backed claims only

PASS STRUCTURE

Required engineering
and handover files

PASS INTEGRITY

SHA-256 checksum
+ Pine invariants

PASS SAFETY

Secret patterns
+ attachment hygiene

PASS RELEASE

Accepted maintained
baseline - v1.0.0

CI and release evidence do not establish profitability, accuracy, latency, or runtime performance.

Check	Verified coverage	Result
Structure	Required engineering and handover files	PASS
Integrity	SHA-256 checksum and Pine invariants	PASS
Lean output	Disallowed TP/SL order and drawing constructs	PASS
Safety	Credential patterns and attachment hygiene	PASS
Release	Accepted maintained baseline	v1.0.0

CI supports repository, integrity, invariant, and disclosure-hygiene claims. It does not establish profitability, accuracy, latency, or runtime performance.

Outcome

The engagement produced a lightweight, documented Pine Script strategy baseline focused on BUY/SELL labels, strategy entries, and configurable alert messages while preserving the requested legacy signal behavior. The delivery was accepted, versioned, checksum-recorded, and supported by CI-backed handover evidence.

What this demonstrates

- Pine Script strategy and indicator audits
- Signal-engine refactoring and simplification
- Multi-timeframe behavior analysis
- State-gated BUY/SELL event engineering
- Strategy-entry and alert-message integration
- Repainting diagnosis and timing trade-off documentation
- CI-backed, confidentiality-safe technical handover

What is intentionally not claimed

- Non-repainting behavior.
- Profitability, win rate, signal accuracy, ROI, savings, or performance percentages.
- Verified latency or execution-speed benchmarks.
- Broker execution, webhook receiver infrastructure, or production automation outside TradingView.
- Identical behavior across every symbol, broker feed, chart type, timeframe, or configuration.
- An independently regenerated runtime screenshot.

RUNTIME EVIDENCE

A safe TradingView runtime was not available in the current environment for independent screenshot regeneration. No screenshot has been fabricated; this showcase relies on architecture, CI, release, and handover evidence.

Disclosure boundary

This public artifact contains no client identity, contact information, private repository URL, credential, endpoint, internal infrastructure, contract/payment detail, private conversation, confidential screenshot, production configuration, or client-delivery source code. The confidential repository remains the engineering source of truth and is not shared in public proposals.

Technology

Pine Script v5	TradingView	Multi-timeframe series	Strategy alerts
Bash	YAML	SHA-256	GitHub Actions

Public showcase controls

The showcase is maintained with independent sanitized history and a public-showcase governance manifest. Its own safety workflow verifies required artifacts, checks the disclosure marker and repository boundary, scans text files for accidental contact or secret patterns, and rejects implementation-source extensions.

Independent history	No delivery-source export
Public manifest	Required artifact checks
Contact / secret scan	Source-extension rejection
